Meet Rekha – A Citizen in Need

Her Profile :

- Age: 38 | Barpeta, Assam
- Occupation: Daily wage earner, ₹8k/month
- Phone: Basic Android, 2G/weak 4G
- Language: Assamese, limited literacy

2023 Assam floods : water rose overnight, house flooded. Stranded on embankment with 6 family members & no aid reached her for 3 days.

She had a phone, signal, urgent need **BUT** lacked visibility, direct channel, structured reporting.

Current Relief Systems Don't Reach Her

- NGOs operate independently; aid often goes to easily accessible areas.
- Nearby cities and larger regions, like Guwahati, received help quickly.
- Small districts like Barpeta, where Rekha lives, were left stranded despite proximity.

- Coordination happens via WhatsApp or social media → delayed and chaotic.
- Relief systems assume literacy, English, or high-speed internet.

The gap : No simple, low-bandwidth, citizen-led way exists to report urgent need and get verified aid quickly.

Our Solution

From User's Perspective

- Opens website → sees one big **"SOS" button**.
- Taps the relevant need like food, medical help, etc through 6 big icons.
- Shares locations and report gets submitted.
- Expanding to major Indian languages to ensure accessibility for all.

What Happens BTS

- Report appears on the NGO heatmap in real time.
- Nearby NGOs see verified clusters and coverage gaps.
- Nearest NGOs can reach hotspots quickly, ensuring faster aid delivery.

Technical Architecture

Scalability & Efficiency

Lightweight UI :

Progressive web app, minimal JS, works on 2G/weak phones.

Efficient Backend :

FastAPI + SQLite (prototype), scalable to Postgres/PostGIS; optionally Firebase/Supabase for millions of concurrent users.

Smart Clustering :

DBSCAN + GeoPandas; only new reports processed, so updates are fast.

Cached Heatmaps :

Stored on backend → updated incrementally, reduces server load, works on weak connections.

Single Endpoint :

Citizens submit → clusters update → NGOs see hotspots, stable even with millions of submissions.

10 Users to 1 Million

Access

Citizens reach the web app via QR codes, NGO broadcasts, community volunteers

Growth

Launch with a pilot in a few communities (10–100 users) then expand through local NGOs and district-level programs & eventually cover all disaster-prone regions over India.

Partnerships

NGOs, community orgs, and government programs help spread awareness and support infrastructure.

Unit Economics

Free for citizens; system can be funded through NGO/government donations or contributions.

Thank You!
